

ACM8629 2×50W Stereo | 1×100W Mono, Digital Input Class-D Audio Amplifier with Rich Audio Effect Tuning

1. Features

- Flexible Power Supply Configurations
 - PVDD: 4.5V to 26.4V
 - DVDD and I/O: 3.3V
- Various output configurations
 - 2×50W, Stereo mode (4Ω, 24V, THD+N < 1%)
 - 1×100W, Mono mode (2Ω, 24V, THD+N < 1%)
- Excellent Audio Performance
 - THD+N ≤ 0.03% at 1W, 1kHz, PVDD = 12V
 - 114 dB A-weighted signal-to-noise ratio (SNR)
 - Idle switching A-weighted noise ≤ 37 μV_{RMS}
 - 28 mA low quiescent current @ PVDD=12V
 - 88% efficiency into 4Ω load ,PVDD=20V,2×40W
- Configurable digital audio interface
 - I²C control with up to 4 selectable addresses
 - I²S, Left-justified, Right-justified, TDM audio format
 - 3-Wire digital audio interface without MCLK required
 - 32kHz, 44.1kHz/48kHz, 88.2kHz/96kHz sample rate
 - SDOUT for Acoustic Echo Cancellation – AEC or 1.1 / 2.1 system sub-channel signal routing
- Advanced audio effect tuning
 - Flexible digital and analog gain adjustment
 - High pass filter for DC blocking
 - Input signal router for left and right channel
 - 2×15 pre BQs & 2×5 post BQs to support enhanced audio frequency tuning
 - Pre volume & post volume for dynamic headroom and loudness control
 - 3 band dynamic range control (DRC) with time delay buffer & post compensation BQs for flexible and flat multiple band control
- Analog protections
 - FAULT status report through GPIO and I²C registers
 - Over current and Direct current protection
 - Over temperature protection
 - Under-voltage and Over-voltage protection
 - Clock error protection

2. Applications

- Portable Speakers: Bluetooth, Smart Speakers with Voice Assistant
- Home Audio: TV, Soundbar, STB (set top box), HTiB (Home Theatre in a Box)
- PCs and Laptops

3. General Description

ACM8629 is a fully integrated, high efficiency, stereo Class-D audio amplifier with digital inputs. The application circuit requires few passives components to operate with 4.5V to 26.4V PVDD supply, 3.3V DVDD supply. It can drive 2×50W output power into BTL 4Ω and 1×100W into PBTL 2Ω@1% THD+N.

ACM8629 features one novel PWM modulation architecture, which adjusts PWM common duty cycle during start-up phase to avoid startup pop click.

Spread spectrum technology provides lower EMI radiated emissions. It allows inductor free application with specified output power situation with ACM8629.

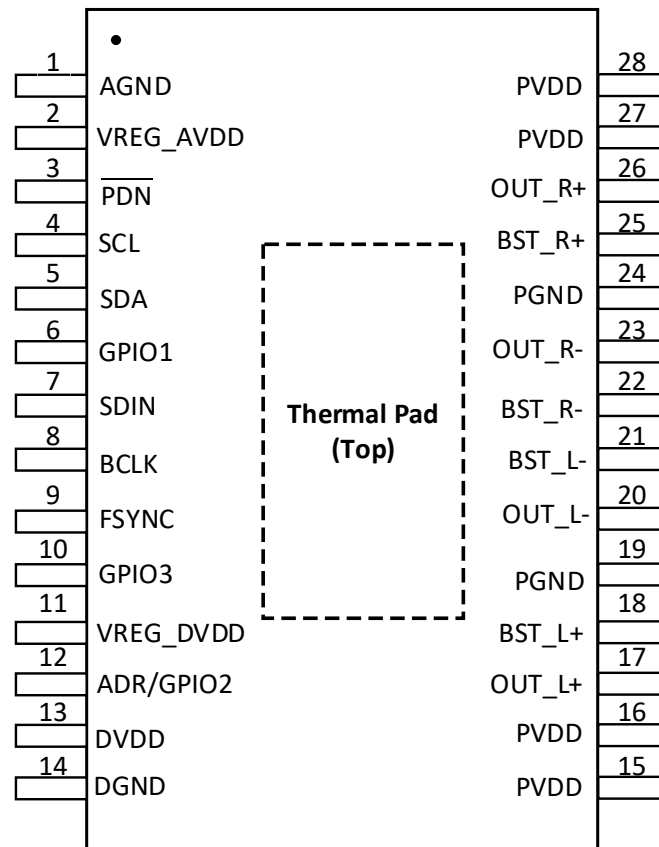

The advanced audio effect tuning capability inside ACM8629 provides one highly integrated solution. It allows turning on / off each block with highly free operations. Both pre and pose BQs / volume helps a lot to maintain audio headroom. Furthermore, 3 band DRC with time delay buffer and post compensation BQs is available to implement flexible and flat multiple band control.

4. Device Information

Part number	Package	Body size
ACM8629	TSSOP 28	9.7 mm × 4.4 mm

5. Pin Configuration and Function Descriptions

ACM8629
TSSOP 28 Pin

Pin No.	Name	Type	Description
1	AGND	PWR	Analog ground.
2	VREG_AVDD	AOUT	Analog regulator output.
3	\overline{PDN}	DIN	Shut down, low active.
4	SCL	DIN	I ² C clock.
5	SDA	DIO	I ² C serial data.
6	GPIO1	DIO	GPIO1: FAULT / WARNING / SDOUT...
7	SDIN	DIN	Serial data input.
8	BLCK	DIN	Bit clock for the digital signal.
9	FSYNC	DIN	Word select clock for the digital signal.
10	GPIO3	DIO	GPIO3: FAULT / WARNING / SDOUT...
11	VREG_DVDD	AOUT	Digital regulator output.
12	ADR/GPIO2	DIO	I ² C address selection / GPIO2: FAULT / WARNING / SDOUT...
13	DVDD	PWR	Digital power supply input: 3.3V.
14	DGND	PWR	Digital Ground.
15	PVDD	PWR	Power stage supply input.
16	PVDD	PWR	Power stage supply input.
17	OUT_L+	AOUT	Left channel positive output of H-bridge.

18	BST_L+	AIN	Bootstrap capacitor for OUT_L+.
19	PGND	PWR	Power stage ground.
20	OUT_L-	AOUT	Left channel negative output of H-bridge.
21	BST_L-	AIN	Bootstrap capacitor for OUT_L-.
22	BST_R-	AIN	Bootstrap capacitor for OUT_R-.
23	OUT_R-	AOUT	Right channel negative output of H-bridge.
24	PGND	PWR	Power stage ground.
25	BST_R+	AIN	Bootstrap capacitor for OUT_R+.
26	OUT_R+	AOUT	Right channel positive output of H-bridge.
27	PVDD	PWR	Power stage supply input.
28	PVDD	PWR	Power stage supply input.

6. Device Family Comparison

Device Name	$R_{ds(on)}$	PVDD	Thermal Pad	Output Power
ACM8628	90 m Ω	4.5V ~ 26.4V	Pad Down	Stereo 2×41W (6 Ω , 24V, THD+N = 1%)
ACM8629	90 m Ω	4.5V ~ 26.4V	Pad Up	Stereo 2×50W (4 Ω , 24V, THD+N < 1%)

7. Specifications

7.1 Absolute Maximum Ratings

		MIN	MAX	UNIT
DVDD	Low-voltage digital supply	-0.3	3.9	V
PVDD	PVDD supply	-0.3	30	V
$V_{I(DIGIN)}$	DVDD referenced digital inputs	-0.5	$V_{DVDD}+0.5$	V
$V_{I(OUTxx)}$	Voltage at speaker output pins	-0.3	32	V
T_A	Ambient operating temperature	-25	85	°C
T_{stg}	Storage temperature	-40	125	°C

- (1) Stressed beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) DVDD referenced digital pins include: ADR/GPIO2, GPIO3, FSYNC, BCLK, SDIN, GPIO1, SDA, SCL, \overline{PDN} .

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001	± 2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
$V_{(SUPPLY)}$	Power supply inputs	DVDD	2.8		3.63	V
		PVDD	4.5		26.4	
	Recommended PVDD Range	BTL Mode, Speaker Load=4 Ω (+/-20% Variation)	4.5		19	V
		BTL Mode, Speaker Load=6 Ω (+/-20% Variation)	4.5		26.4	
		BTL Mode, Speaker Load=8 Ω (+/-20% Variation)	4.5		26.4	
		PBTL Mode, Speaker Load=2 Ω (+/-20% Variation)	4.5		19	
		PBTL Mode, Speaker Load=3 Ω (+/-20% Variation)	4.5		26.4	
		PBTL Mode, Speaker Load=4 Ω (+/-20% Variation)	4.5		26.4	
$V_{IH(DIGIN)}$	Input logic high for DVDD reference digital inputs		$0.9 \times DVDD$		DVDD	V
$V_{IL(DIGIN)}$	Input logic low for DVDD reference digital inputs				$0.1 \times DVDD$	
L_{OUT}	Minimal inductor value in LC filter under short-circuit condition		1			μH
T_J	Junction Operating Temperature		-40		150	°C
T_A	Ambient Operating Temperature		-40		85	°C

7.4 Thermal Information

		ACM8629 TSSOP 28 PINS JEDEC STANDARD 4-LAYER PCB	UNIT
θ_{JA}	Junction-to-ambient thermal resistance	14	°C/W
θ_{JT}	Junction-to-case (top) thermal resistance	1.2	°C/W
ψ_{JT}	Junction-to-top characterization parameter	5.7	°C/W

7.5 Electrical Characteristics

Free-air room temperature 25° C, LPD mode, LC filter=10uH+0.68uF, Fsw=480kHz, (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
DIGITAL I/O						
IIH	Input logic high current level for DVDD referenced digital input pins	$V_{IN(Digin)} = V_{DVDD}$			10	μA
IIL	Input logic low current level for DVDD referenced digital input pins	$V_{IN(Digin)} = 0\text{ V}$			-10	μA
$V_{IH(Digin)}$	Input logic high threshold for DVDD referenced digital inputs		70%			V_{DVDD}
$V_{IL(Digin)}$	Input logic low threshold for DVDD referenced digital inputs				30%	V_{DVDD}
$V_{OH(Digin)}$	Output logic high threshold for DVDD referenced digital inputs	$I_{OH} = 2\text{ mA}$	80%			V_{DVDD}
$V_{OL(Digin)}$	Output logic low threshold for DVDD referenced digital inputs	$I_{OH} = -2\text{ mA}$			20%	V_{DVDD}
I²C CONTROL PORT						
$C_{L(I2C)}$	Allowable load capacitance for each I ² C line				400	pF
$F_{SCL(fast)}$	Support SCL frequency	No wait states, fast mode			400	kHz
$F_{SCL(slow)}$	Support SCL frequency	No wait states, fast mode			100	kHz
SERIAL AUDIO PORT

9. Detailed Description

9.1 Overview

The ACM8629 device integrates 4 main building blocks together into a single cohesive device that maximizes sound quality, flexibility, and ease of use. The 4 main building blocks are listed as follows:

- A stereo audio DAC
- An Audio Effect Tuning engine
- A flexible closed-loop amplifier capable of operating in stereo or mono, at different switching frequencies, and supporting a variety of output voltages and loads
- An I²C control port for communication with the device

The device requires only two power supplies for proper operation. A DVDD supply is required to power the low voltage digital circuitry. Another supply, called PVDD, is required to provide power to the output stage of the audio amplifier. Two internal LDOs convert PVDD to 5V for VREG_AVDD and 3.3V for VREG_DVDD respectively.

9.2 Functional Block Diagram

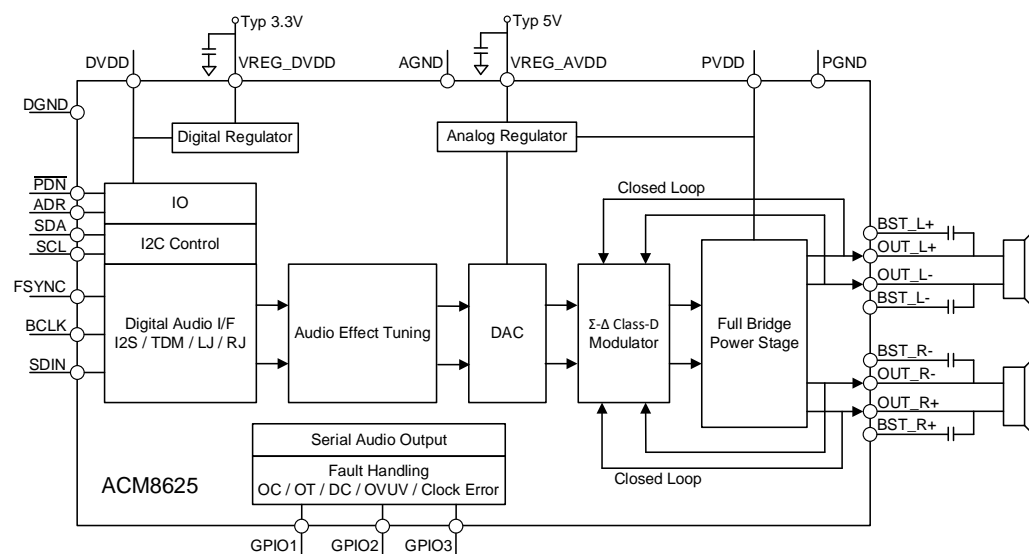

Figure 24 Function Block Diagram

9.3 Device Clocking

9.3.1 Main Clocks

The ACM8629 device has flexible systems for clocking. Internally, the device requires a number of clocks, mostly at related clock rates to function correctly. All of these clocks can be derived from the Serial Audio Interface.

The serial audio interface typically has 3 connection pins which are listed as follows:

- BCLK
- FSYNC/LRCLK (Left/Right Word Clock and Frame Sync)

- SDIN (Input Data)

The device has an internal PLL that is used to take BCLK as reference clock and create the higher rate clocks required by the Audio Effect Tuning and the DAC clock.

The ACM8629 device has an audio sampling rate detection circuit that automatically senses the sampling frequency. Common audio sampling frequencies of 32kHz, 44.1kHz-48kHz, 88.2kHz-96kHz, 176.4kHz-192kHz are supported. The sampling frequency detector sets the clock for DAC and Audio Effect Tuning automatically.

The ACM8629 device has an audio sampling rate detection circuit that automatically senses the sampling frequency. Common audio sampling frequencies of 32kHz, 44.1kHz-48kHz, 88.2kHz-96kHz, 176.4kHz-192kHz are supported. The sampling frequency detector sets the clock for DAC and Audio Effect Tuning automatically.

9.3.2 Serial Audio Port – Clock Rates

The serial audio interface port is a 3-wire serial port with the signals FSYNC/LRCLK, BCLK, and SDIN. BCLK is the serial audio bit clock, used to clock the serial data present on SDIN into the serial shift register of the audio interface. Serial data is clocked into the ACM8629 device on the rising edge of BCLK. The FSYNC/LRCLK pin is the serial audio left/right word clock or frame sync when the device is operated in TDM mode.

Table 3. Audio Data Formats, Bit Depths and Clock Rates

FORMAT	DATA BITS	MAXIMUM LRCLK/FS FREQUENCY (kHz)	BCLK RATE (Fs)
I ² S/LJ/RJ	32,24,20,16	32 to 96	64,32
TDM	32,24,20,16	32	128
		44.1/48	128,256,512
		96	128,256

When clock halt, non-supported BCLK to FSYNC/LRCLK ratio is detected, the device reports clock error in Register 0x18 in Page0.

9.3.3 Clock Halt Auto-recovery

As some of host processor halts I²S clock when there is no audio playing. After clock halt, the device puts all channels into Hi-Z state and reports clock error in register 0x18 in Page0. After audio clock recovery, the device automatically returns to the previous state.

9.3.4 Sample Rate on The Fly Change

ACM8629 supports FSYNC/LRCLK rate on the fly change. For example, change FSYNC/LRCLK from 32kHz to 48kHz or 96kHz, Host processor needs to put LRCLK (FSYNC) to Halt state at least 10ms before changing to new sample rate.

9.3.5 Serial Audio Port – Data Formats and Bit Depths

The device supports industry-standard audio data formats, including standard I²S, left-justified, right-justified and TDM/DSP data. Data formats are selected via Register 0x07 in Page0. If the high width of FSYNC/LRCLK in TDM/DSP mode is less than 8 cycles of BCLK, the register Page0/0x07 D[5:4] should be set to 01. All formats require binary two's complement, MSB-first audio data, up to 32-bit audio data is accepted. All the data formats,

word length and clock rate supported by this device are shown in Table 1. The data formats are detailed in Figure 25 to Figure 29. The word length are selected via Register Page0/0x07 D[1:0]. The offset of data is selected via Register Page0/0x08.

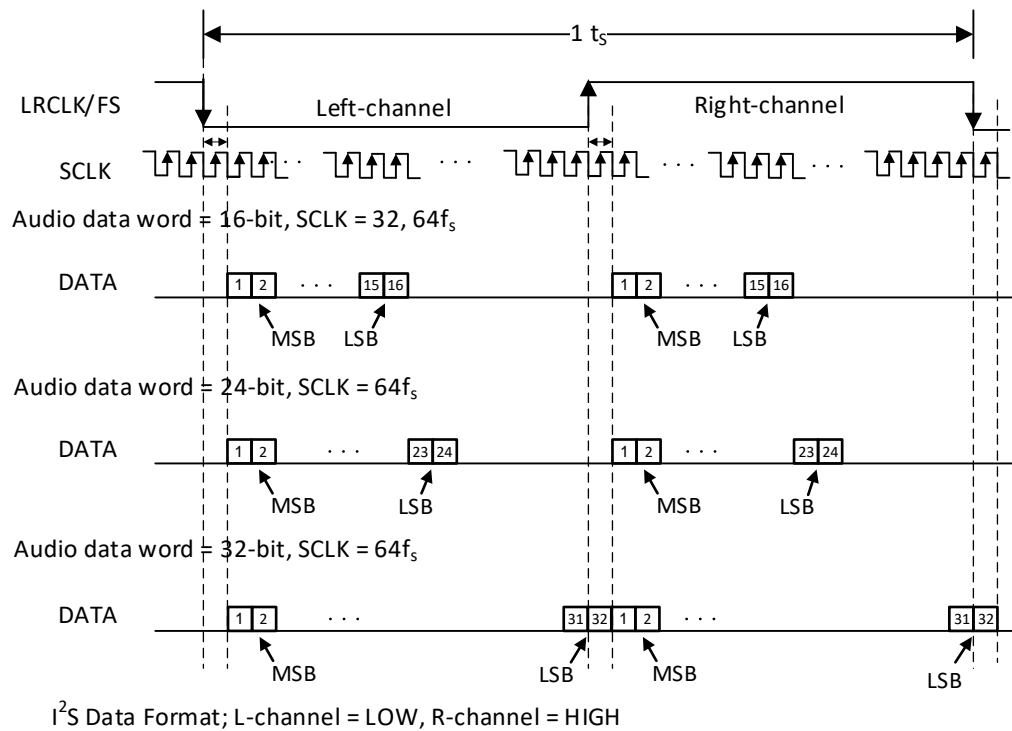

Figure 25 I²S Audio Data Format

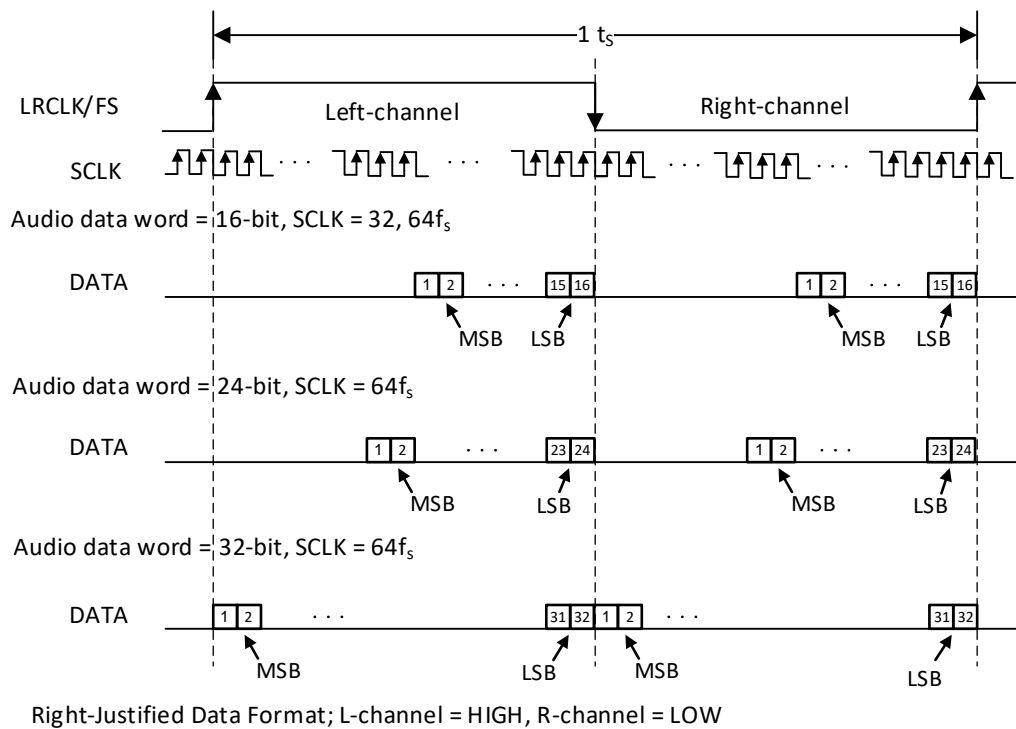

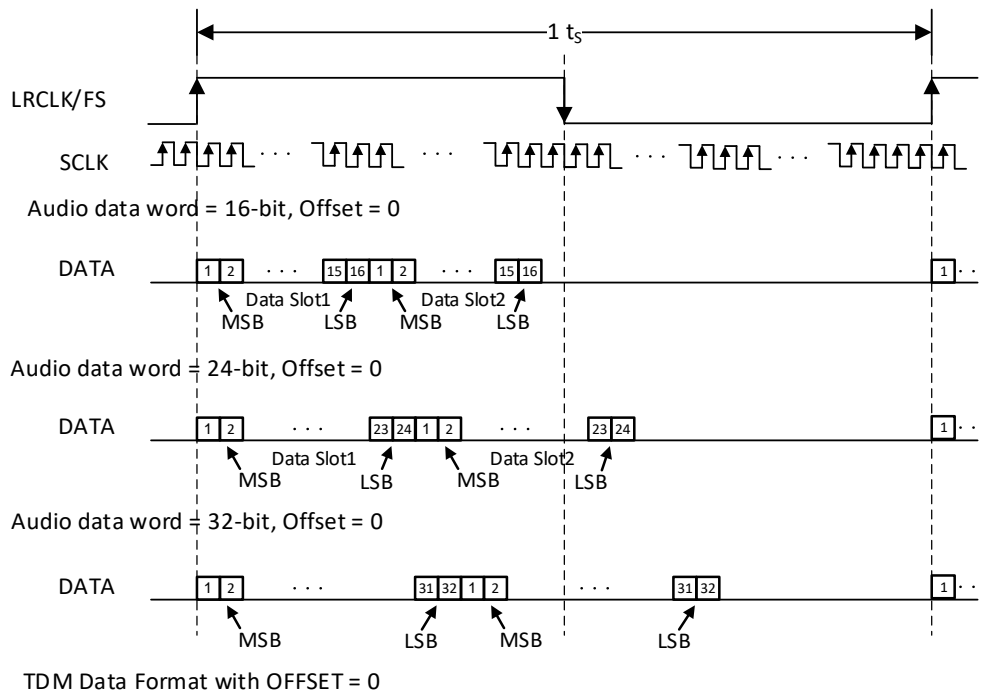

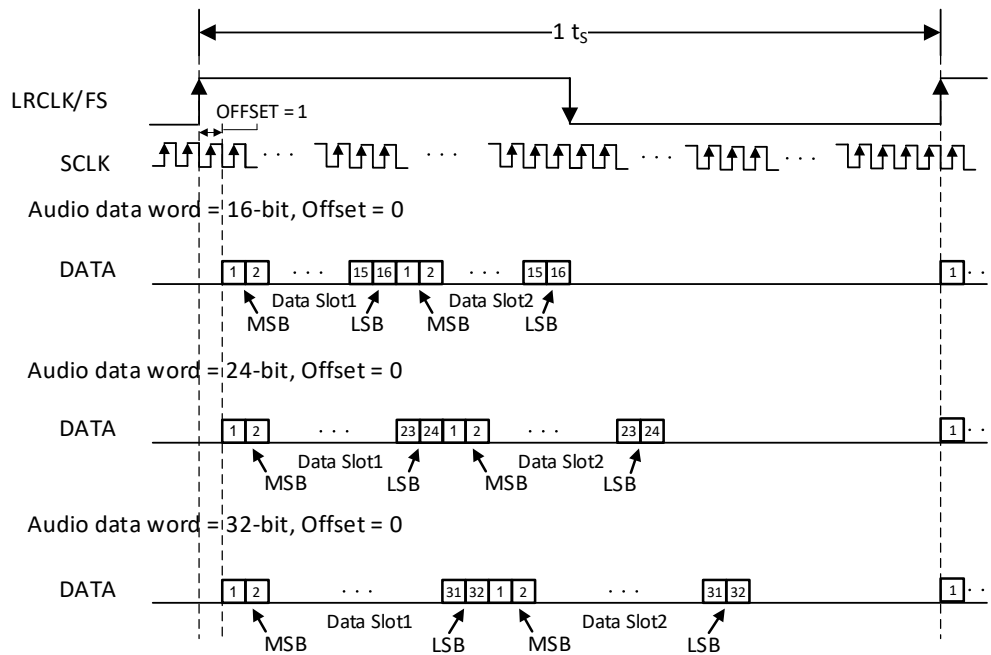

Figure 27 Right-Justified Audio Data Format

In TDM Modes, Duty Cycle of LRCLK/FS should be 1× SCLK at minimum. Rising edge is considered frame start

Figure 28 TDM 1 Audio Data Format

TDM Data Format with OFFSET = 1

In TDM Modes, Duty Cycle of LRCLK/FS should be $1 \times \text{SCLK}$ at minimum. Rising edge is considered frame start

Figure 29 TDM 2 Audio Data Format

9.4 Power Supplies

To facilitate system design, ACM8629 needs only a 3.3-V supply in addition to (4.5V~26.4V) power-stage supply. Two internal voltage regulators provide suitable voltage levels for the gate drive circuitry and internal circuitry. The external pins are provided only as a connection point for off-chip bypass capacitors to filter the supply. Connecting external circuitry to these regulators may result in reduced performance and damage to the device. Additionally, all circuitry requiring a floating voltage supply, e.g., the high-side gate drive, is accommodated by built-in bootstrap circuitry requiring only a few external capacitors. In order to provide good electrical and acoustical characteristics, the PWM signal path for the output stage is designed as identical, independent half-bridges. For this reason, each half-bridge has separate bootstrap pins (BST_x). The gate drive voltages (VREG_AVDD) are derived from the PVDD voltage. Special attention should be paid to placing all decoupling capacitors as close to their associated pins as possible. In general, inductance between the power-supply pins and decoupling capacitors must be avoided. For a properly functioning bootstrap circuit, a small ceramic capacitor must be connected from each bootstrap pin (BST_x) to the power-stage output pin (OUT_x). When the power-stage output is low, the bootstrap capacitor is charged through an internal diode connected between the gate-drive regulator output pin (VREG_AVDD) and the bootstrap pin. When the power-stage output is high, the bootstrap capacitor potential is shifted above the output potential and thus provides a suitable voltage supply for the high-side gate driver.

9.5 Device Gain Setting

As seen in the figure below, the audio path of the ACM8629 consists of a digital audio input port, a digital audio path, a digital to PWM convertor, a gate driver stage, a Class D power stage, and the feedback loop which feeds the output information back into the digital to PWM block to correct for distortion sensed on the output pins. The

total amplifier gain is comprised of digital gain in the digital audio path and the analog gain from the input of the analog modulator to the output of the speaker amplifier power stage.

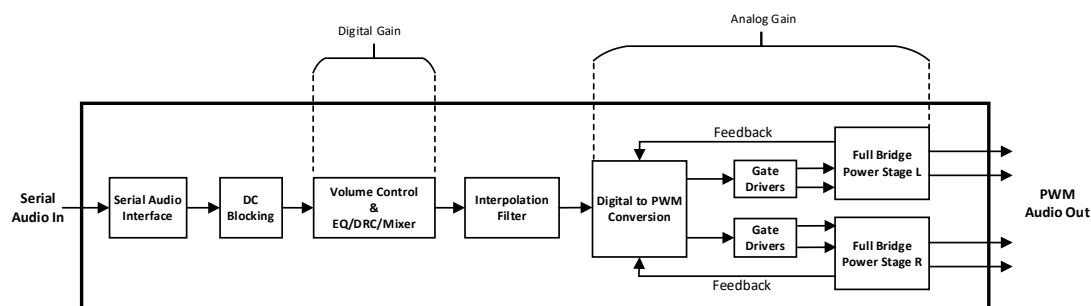

Figure 30 Gain Structure

As shown above, the first gain stage for the speaker amplifier is present in the digital audio path. It consists of the volume control and EQ/DRC/Mixer. The volume control is set to 0dB by default and EQ/DRC/Mixer is bypassed by default.

Amplifier analog gain settings are presented as the output level in dBV (dB related to 1Vrms) with a full-scale serial audio input (0dBFS) and the digital volume control set to 0dB.

$$V_{AMP} = \text{Input} + \text{Digital Gain} + \text{Analog Gain dBV}$$

Where:

- V_{AMP} is the amplifier output voltage in dBV_{RMS}
- Input is the digital input amplitude in dB with respect to 0dBFS
- Digital Gain is the digital volume control setting, -110dB to 24dB.
- Analog Gain is the analog gain setting (26.38dB, 25.88dB, 25.38dB to 10.88dB in 0.5dB step)

Table 2 outlines gain setting expressed in dBV_{RMS} and V_{PEAK} .

Table 4 Amplifier Gain Settings

Analog Gain (Register 0x02h in Page0)	FULL SCALE OUTPUT	
	dBV_{RMS}	V_{PEAK}
00000	26.38	29.5
00001	25.88	27.84
00010	25.38	26.3
00011	24.88	24.8
...
01110	19.38	13.17
01111	18.88	12.44
10000	18.38	11.74
...
11111	10.88	4.95

9.6 Device Protection

ACM8629 has built-in protection circuits including thermal, short-circuit, under-voltage detection, over-voltage detection, output DC detection, clock error detection circuits. Once these faults occur, ACM8629 reports fault via register 0x17h-0x19h in Page0 and these faults may pull the GPIO0/1 pin to DGND by proper setting in Register 0x0Ah and 0x0Ch in Page0. Clear these faults by writing Bit7 in register 0x01h in Page0 from 0 to 1.

1. Over temperature protection. When the internal junction temperature is higher than 160°C power stages

will be turned off and ACM8629 will return to normal operating once the temperature drops to 150°C. The temperature values may vary around 10%. Enable Over temperature protection auto-recovery by writing Register 0x11h (Bit 2) from 0 to 1.

2. Short-circuit protection. The short-circuit protection protects the output stage when the wires connect to loudspeakers are shorted to each other or GND/PVDD. For normal 24V operations, the current flowing through the power stage will be less than 6.5A for stereo configuration. Otherwise, the short-circuit detectors pull the FAULT pin (GPIO pin) to DGND, disabling the output stages.
3. PVDD over-voltage protection. Once the PVDD voltage is higher than 28V, ACM8629 turns off its loudspeaker power stages. When PVDD becomes lower than 27.5V, ACM8629 will return to normal operation.
4. PVDD under-voltage protection. Once the PVDD voltage is lower than 4V, ACM8629 turns off its loudspeaker power stages. When PVDD becomes higher than 4.3V, ACM8629 will return to normal operation.
5. Speaker DC Protection. Once the output differential voltage exceeds 1.9V (typical) for more than 570ms (typical) at the same polarity. ACM8629 will turn off its loudspeaker stages. Once this fault been removed, clear this fault by writing Bit7 in register 0x01h from 0 to 1 or device will keep output stages in Hi-Z state.
6. Clock error protection. When clock halt, non-supported BCLK to FSYNC/LRCLK ratio is detected, the device reports clock error in Register 0x18 in Page0. Once the fault been removed, device will return to normal operation.

9.7 Class H Control

ACM86xx Class-H Control provides a new scheme to increase efficiency and reduce power dissipation for battery supply system. ACM86xx internal Class H block monitors the digital audio signal and provides control signal to feedback network of external DC-DC Boost Convertor, adjust Boost Convertor's V_{OUT} accordingly. As ACM86xx use the external Booster Convertor's V_{OUT} as the power supply, so ACM86xx's Power supply dynamic tracking with output audio signal, shown in Figure 31.

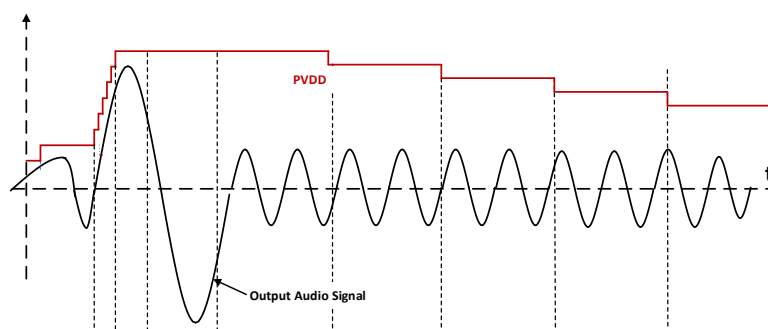

Figure 31 Class H Operation Signal

ACM86xx employ an internal Audio Signal Amplitude Detection Block for audio signal amplitude detection, as the target PVDD range and the amplifier system gain is known, so the digital input levels in 'Levels to PWM' block will calculate the proper digital input levels and transfers to different duty cycle. Generally, ACM86xx supports 16 levels Class H Control. For example, if the PVDD range is 9V-16V, the PVDD tracking with output audio signals by following values: { 9V, 9.466V, 9.933V, 10.399V, 10.866V, 11.333V, 11.799V, 12.266V, 12.732V, 13.199V, 14.132V, 14.599V, 15.065V, 15.532V, 15.999V }.

Based on detailed system application requirement (PVDD min/max value, V_{FB} of the Booster Convertor, DVDD value, R_2), ACME Audio Tuning software generates corresponding register configuration and external BOM which

shown in Figure 32.

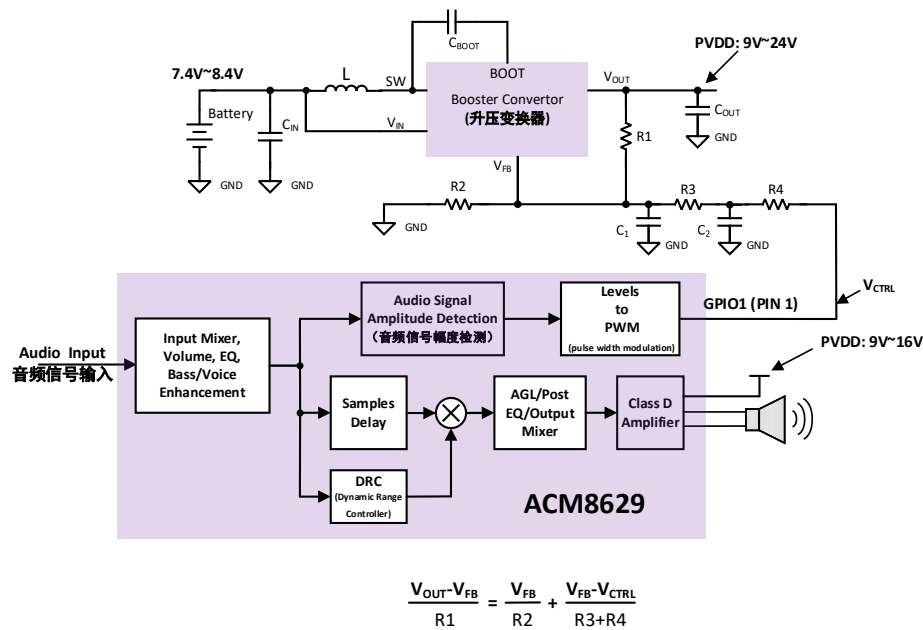

Figure 32 Class H Control Block

9.8 Spread Spectrum

ACM8629 supports spread spectrum with triangle mode. Spread spectrum is used to minimize the EMI noise.

Enable spread spectrum in register 0x0Eh in Page 0, default is disable.

Enable Spread Spectrum Script with following sequence (Suitable for 384kHz/480kHz/576kHz switching frequency):

1. Step1, Write content 0x00 to Register address 0x00.
2. Step2, Write content 0x01 to Register address 0x0E.
3. Step3, Write content 0x01 to Register address 0x00.
4. Step4, Write content 0x02 to Register address 0x1A.
5. Step5, Write content 0x00 to Register address 0x00.

9.9 I²C Device Address

The ACM8629 device has 7 bits for I²C device address. The first five bits (MSBs) of the device address are factory preset to 00101 (0x2x). The next two bits of address byte are the device select bits which can be user-defined by ADR pin in Table 5.

Table 5 I²C Device Address Configuration

ADR PIN Configuration	MSBs					User Define		LSB	Device Write Address
4.7kΩ to DVDD	0	0	1	0	1	0	0	R/W	0x28
15kΩ to DVDD	0	0	1	0	1	0	1	R/W	0x2a
47kΩ to DVDD	0	0	1	0	1	1	0	R/W	0x2c
120kΩ to DVDD	0	0	1	0	1	1	1	R/W	0x2e

9.10 Start-up sequence

1. Configure ADR/GPIO2 pin with proper setting for I²C device address.
2. Bring up power supplies.
3. Once all power supplies are stable, bring up the PDN pin HIGH 1ms before I²C communication.
4. Configure the device via I²C control port based on the user case (Make sure the PDN pin= HIGH before I²C control port operating).
5. The device is now in normal operation.

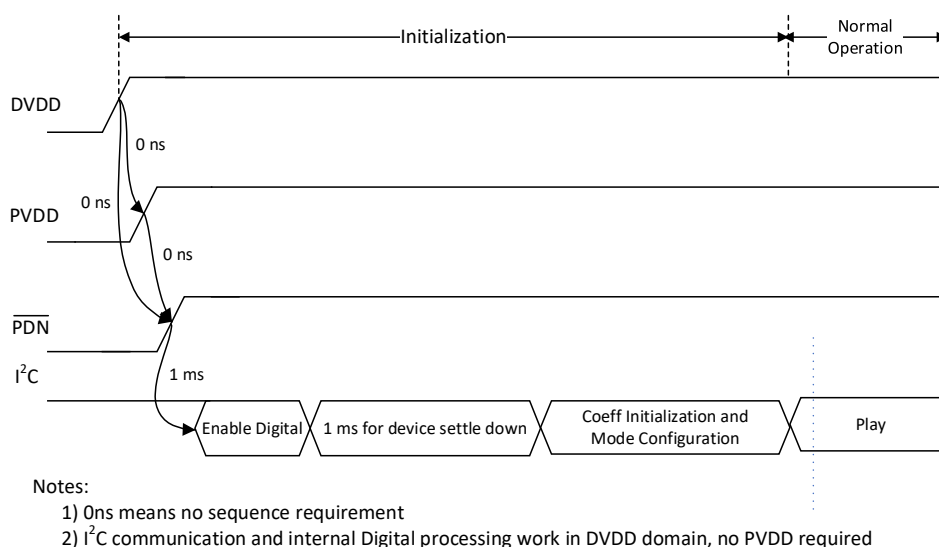

Figure 33 Start-up Sequence

9.11 Shutdown sequence

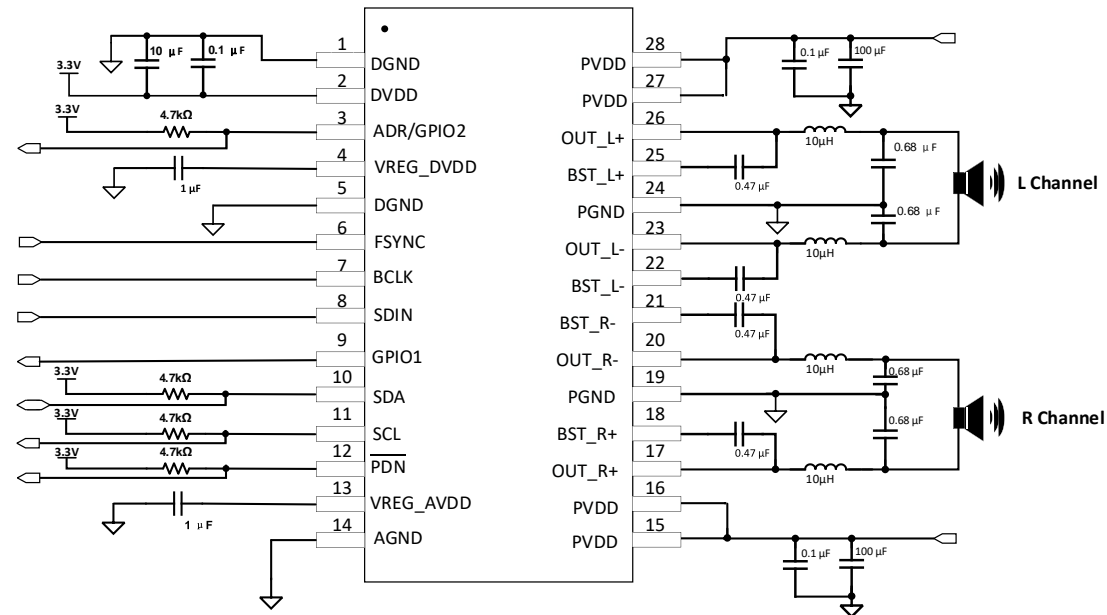

1. The device is in normal operation.
2. Configure the device in digital off state via register 0x04h or pull PDN low.
3. Wait at least 6ms (This time depends on the FSYNC rate, digital volume and digital volume ramp down rate).
4. Bring down power supplies.
5. The device is now fully shutdown and powered off.

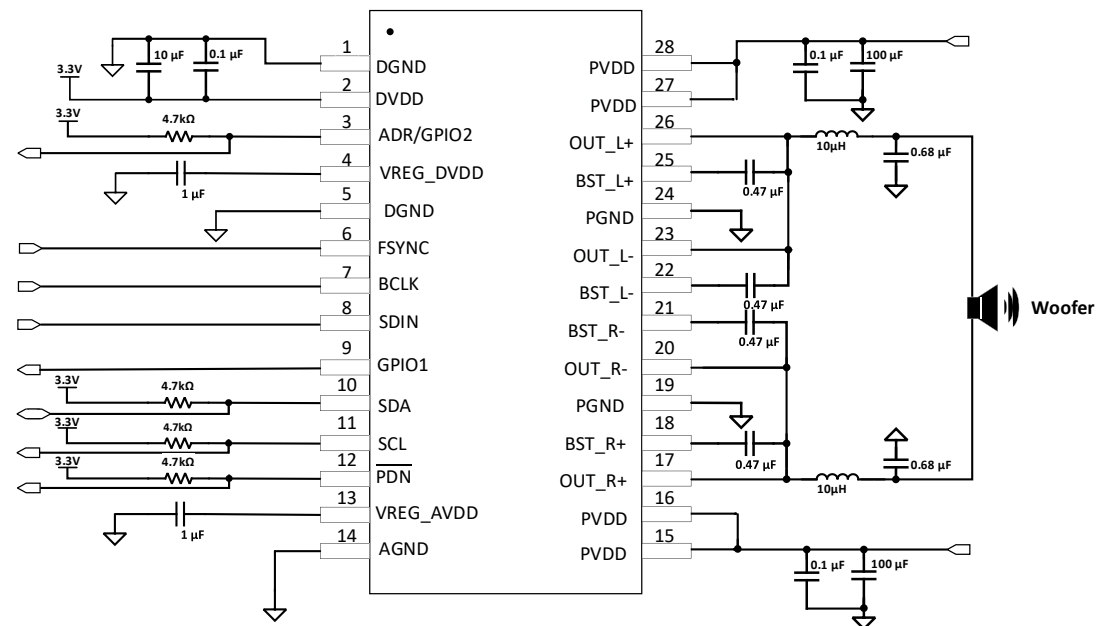

- Before PVDD/DVDD power down, Class D Output driver needs to be disabled by $\overline{\text{PDN}}$ or by I²C.
- At least 6ms delay needed based on LRCLK (Fs) = 48kHz, Digital volume ramp down update every sample period, decreased by 0.5dB for each update, digital volume = 24dB.

Figure 34 Shutdown Sequence

Bit	Field	Type	Reset	Description
7-2	RESERVED	R	000000	These bits are reserved
1-0	STATE_RPT	R	00	00: Digital Off 01: Analog Off 10: Driver Off (Hiz) 11: Play

13.1.22 Register 22 FAULT_RPT1(Offset=17h) [Reset=0x00]

7	6	5	4	3	2	1	0
RESERVED	OTSD	PVDD_OV	PVDD_UV	CH2_DC	CH1_DC	CH2_OC	CH1_OC
R	R	R	R	R	R	R	R

Bit	Field	Type	Reset	Description
7	RESERVED	R	0	This bit is reserved
6	OTSD	R	0	0: Normal 1: Over temperature shutdown fault report
5	PVDD_OV	R	0	0: Normal 1: PVDD over-voltage fault report
4	PVDD_UV	R	0	0: Normal 1: PVDD under-voltage fault report
3	CH2_DC	R	0	0: Normal 1: CH2 speaker DC fault report
2	CH1_DC	R	0	0: Normal 1: CH1 speaker DC fault report
1	CH2_OC	R	0	0: Normal 1: CH2 over-current fault report
0	CH1_OC	R	0	0: Normal 1: CH1 over-current fault report

13.1.23 Register 23 FAULT_RPT2(Offset=18h) [Reset=0x00]

7	6	5	4	3	2	1	0
RESERVED					CLK_FAULT	RESERVED	
R					R	R	

Bit	Field	Type	Reset	Description
7-3	RESERVED	R	00000	This bit is reserved
2	CLK_FAULT	R	0	0: Normal 1: Clock fault report
1-0	RESERVED	R	0	This bit is reserved

13.1.24 Register 24 FAULT_RPT3(Offset=19h) [Reset=0x00]

7	6	5	4	3	2	1	0
RESERVED					CH2_CLIP	CH1_CLIP	OTW
R					R	R	R

Bit	Field	Type	Reset	Description
7-3	RESERVED	R	00000	This bit is reserved
2	CH2_CLIP	R	0	0: Normal 1: Channel 2 clipping
1	CH1_CLIP	R	0	0: Normal 1: Channel 1 clipping
0	OTW	R	0	0: Normal 1: Over temperature warning

13.1.25 Register 25 XOR_CHECKSUM(Offset=7Eh) [Reset=0x00]

7	6	5	4	3	2	1	0
XOR_CHECKSUM							
R							

Bit	Field	Type	Reset	Description
7-0	XOR_CHECKSUM	R	0	XOR checksum result

13.1.26 Register 26 CRC_CHECKSUM(Offset=7Fh) [Reset=0x00]

7	6	5	4	3	2	1	0
CRC_CHECKSUM							
R							

Bit	Field	Type	Reset	Description
7-0	CRC_CHECKSUM	R	0	CRC checksum result

13. Package Dimensions
